

# ABSTRACT

A word-device setting information storage part stores multiple device setting information in association with a single voice and a voice recognition part recognizes a voice input through a voice input part so that the multiple device setting information associated with the recognized voice is read from the word-device setting information storage part to a device control part, which in turn sets an internal device state of a device setting apparatus while an external device control part sets a state of an external device in response to the read multiple device setting information.
